4/1/14

Centroid Products has been manufacturing capacitance-based fuel-level senders since 1990. This flexible version uses stiff springs as the sensing elements to allow the sender to be inserted into the tank without lowering the tank for clearance.

The unit shown has 1/2 inch NPT threads for mounting. It is also available with different NPT sizes or the SAE 5-screw mounting pattern. A Packard Metripack connector is shown. Other connection options are available.

The output is factory-programmable to allow us to match a customer's desired voltage or resistance range. A 12-volt supply voltage is standard but we can configure the senders for a 5-volt supply. A low- and/or high-alarm output can be provided.
